Imagine a situation where one team member wants to solve a problem a certain way, but other team members have a completely different approach. They ask for your help. How would you handle this situation?

Answer:

First, I'll let them understand why they're a team, and why it's important to work together for the same end/goal even if they disagree on the means.

While it may be rational to put it to a vote, turning a blind eye to the approach of the 'one team member' could prove to be costly for the team if not scrutinized properly.

So, my advice would be to carefully study the approach of the one team member, if loopholes are found in his approach, then the team should not implement it, and let the team move ahead with the majority's completely different approach.

Thanks.
